

Amorphous flyback energy storage

Are amorphous MOFs good for energy storage?

Amorphous MOFs, which lack any long-range periodic order in the framework, exhibit several properties that are beneficial for energy storage such as isotropic conduction, higher ionic and electrical conductivity, increased defect sites and enhanced electrochemical stability.

Can amorphization enhance the stability of energy storage devices?

Meanwhile, the incorporation of structural disorder in MOF composites holds the potential to enhance the stability of energy storage devices. With the wide range of MOF composites already reported, there are ample opportunities to further enhance their performance stability by exploring amorphization.

Can self-supported amorphous nanomaterials be used for energy storage and conversion devices?

In particular, tremendous efforts have been devoted to the design, fabrication, and evaluation of self-supported amorphous nanomaterials as electrodes for energy storage and conversion devices in the past decade.

What are amorphous materials?

Amorphous materials with unique structural features of long-range disorder and short-range order possess advantageous properties such as intrinsic isotropy, abundant active sites, structural flexibility, and fast ion diffusion, which are emerging as prospective electrodes for electrochemical energy storage and conversion.

Why do amorphous nanomaterials have a built-in electric field?

The built-in electric field formed at the amorphous/crystalline heterointerface lowers the reaction energy barriers, provides additional active storage sites, and effectively regulates the charge transfer kinetics. How can amorphous materials improve the stability of post-Lib batteries?

In this regard, the advances in flexibility and isotropy of amorphous materials could offer numerous ion migration pathways for the respective electrodes, resulting in smaller volume variation when the heavier ions intercalate into the layers. This clearly helps to improve both the capacity and the stability of the post-LIB batteries.
