

# Antiferroelectric energy storage

Are antiferroelectrics suitable for high-performance energy storage?

Antiferroelectrics with antiparallel dipole configurations have been of significant interest for high-performance energy storage due to their negligible remanent polarization and high maximum polarization in the field-induced ferroelectric state [6, 7, 8].

Why do ANT50 MLCCs have a high energy storage density?

Because the decrease of off-center cations displacement contributes to the high breakdown strength and low energy loss, ultrahigh energy storage density  $U_{ec} = 12.6 \text{ J cm}^{-3}$  and efficiency  $\eta > 94\%$  were achieved in the ANT50 MLCCs.

Can non-polar nanodomains improve energy storage performance in antiferroelectrics?

This strategy presents new opportunities to manipulate polarization profiles and enhance energy storage performances in antiferroelectrics. This study reports that incorporating non-polar nanodomains into antiferroelectrics greatly enhanced the energy density and efficiency.

Are aqueous zinc-ion batteries a good energy storage device?

Among them, aqueous zinc-ion batteries (AZIBs) have attracted much attention, and is considered to be one of the ideal energy storage devices owing to their high safety, environmental friendliness, easy assembly, low cost, and high energy density [,,,,].

Why are energy storage properties superior?

The superior energy storage properties can be attributed to the enhanced breakdown property, large polarization fluctuation and delayed polarization saturation.

Which phase transition induced excellent capacitive energy storage performance in antiferroelectric ceramics?
