

Copper foil thickness and energy storage

How can Composite copper foil improve the energy density of a battery?

Increasing energy density Composite copper foil with a sandwich structure can significantly reduce the weight of the current collector, thereby enlarging the energy density of the battery. In addition, the rough surface of composite copper foil can enhance the bonding strength between current collector and active material.

What are the advantages of Composite copper foil?

Compared with traditional electrolytic copper foil, composite copper foil with a distinctive "Cu-polymer-Cu" sandwich structure significantly reduces the weight of current collector and increases the energy density of battery.

What is the thickness of copper foil?

To ensure high energy density and good flexibility, copper layers with the thickness of 1 μm are deposited on both side of polymer interlayer. Compared with traditional 6 μm electrolytic copper foil, the significant difference in copper layer thickness is the main limiting factor to conductivity of composite copper foil.

How does copper foil affect battery performance?

Conductivity is Key: Copper's exceptional conductivity allows more power to flow through the battery, boosting its overall performance and enabling faster charging and discharging. Thickness Matters: The thickness of the ED copper foil directly affects the battery's capacity and form factor.

Why should we use copper & aluminum composite foils in energy storage?

At the same time, the raw material price of aluminum is much lower than that of copper, which can lead to a reduction in the raw material cost of the battery. Therefore, copper-aluminum composite foils are expected to be applied in the energy storage field that prioritizes high energy density and lightweight over excellent cycling performance.

What is the thermal stability of copper foil?

High thermal stability of up to 500 degrees celsius. n.b. standard copper foil shows 300 to 400 MPa at 100% IACS and softens at 200 degrees celsius. Targray supplies a complete line of high-performance rolled annealed (RA) copper foil products designed specifically for lithium-ion battery applications.
