

Flywheel energy storage thermal power frequency regulation project

Is a flywheel energy storage system suitable for frequency modulation?

The flywheel energy storage system is also suitable for frequency modulation. In power generation enterprises, the primary flexible operation abilities of the units which will be evaluated by the power grid are their frequency regulation and automatic generation control (AGC) instruction tracking capabilities.

Can flywheel energy storage be used in secondary frequency regulation?

The Shandong company's flywheel energy storage project, designated as a demonstration project by the National Energy Administration, aims to explore the potential of flywheel storage technology in secondary frequency regulation for Automatic Generation Control (AGC).

How to control thermal power unit with flywheel energy storage array?

A coordinated control scheme for the thermal power unit with flywheel energy storage array is proposed. Frequency modulation and AGC instruction tracking scenario models are constructed and simulated. AGC regulation indicators are conducted and analyzed to evaluate the unit's performance.

Can flywheel energy storage improve operational flexibility of thermal power units?

The regulation speed and response time of the unit are significantly improved. Additionally, AGC compensation is increased. In summary, the flywheel energy storage system has shown promising results in improving the operational flexibility of thermal power units. Both steady-state and dynamic operations can be optimized with the assistance of FESA.

What is a flywheel energy storage array?

A project that contains two combined thermal power units for 600 MW nominal power coupling flywheel energy storage array, a capacity of 22 MW/4.5 MWh, settled in China. This project is the flywheel energy storage array with the largest single energy storage and single power output worldwide.

Can flywheels be used in thermal power plants?
