

Hybrid solar storage cost vs benefit calculation in Nepal

Can solar-powered water pumping systems be used in Nepal?

In Nepal's Gandaki Province, the solar-powered pumping system proved to be a more cost-effective and suitable alternative to electricity-based water pumping systems. The potential applicability of this successful solar pumping system can therefore be assessed for Nepal's hilly terrain [,,].

How a solar energy storage system works?

A well-designed solar energy storage system can be implemented for continuous and uninterrupted supply of water even during periods . Natural outcrops, such as natural springs, are crucial inland water sources in hilly terrains. The fresh water is gathered in loading tanks and then distributed to consumers.

What is the cost-effectiveness index of solar power?

The cost-effectiveness index of the system that uses electric power and solar power is tabulated below (Table 11). If the profitability index is more than 1, then it is considered a profitable project and can potentially be operated using solar power.

Should the government consider solar power as a feasible alternative to electricity?

The government should review the water supply policy, considering solar power as a feasible alternative to electricity in water supply schemes if it is deemed achievable and effective. 5. Conclusions

Are solar energy-based WSS operations economically feasible?

The study demonstrates that solar energy-based WSS operations are technically and economically feasible, with profitability indexes exceeding 1, making them suitable for similar geographic regions. 4.

Is solar power pumping more cost-effective than electric pumping system?

The solar power pumping system is found to be more cost-effective. Seasonal variation of sunlight made a difference as the pump cannot lift full water in cloudy periods. The payback period of the selected project was higher than that of the electric pumping system.
