

Long term savings with NMC battery storage installation

How long do NMC batteries last?

This figure is somewhat higher than that presented by NCA solutions such as Tesla's (70% after 3,000 cycles); and much higher than the theoretical life of NMC batteries (with a total of around 2,000 cycles, although their capacity is usually significantly reduced after 1,000 cycles, retaining only around 60% of the nominal capacity).

What is the difference between NMC and LFP batteries?

NMC batteries typically deliver 250-300 Wh/kg, benefiting from their layered oxide structure which supports high-voltage operation and superior specific capacity. LFP batteries, in contrast, range between 160-200 Wh/kg, due to their olivine crystal structure which limits lithium-ion diffusion pathways.

Which chemistry is best for stationary battery energy storage?

While both chemistries serve important roles, LFP is rapidly becoming the standard for stationary battery energy storage thanks to its: You are deploying a long-duration or grid-scale project where safety, longevity and cost are critical.

What is a stationary battery energy storage system (BESS)?

As the global energy transition accelerates, stationary battery energy storage systems (BESS) have emerged as critical infrastructure for balancing intermittent renewables, enhancing grid reliability and enabling decentralised energy ecosystems.

What is the difference between LFP and NMC?

Here's how LFP and NMC compare: LFP: Contains no cobalt or nickel; iron and phosphate are widely available with relatively benign mining processes. NMC: Contains cobalt (often sourced from artisanal mines with poor labour conditions) and nickel (linked to significant water and land pollution).

Which chemistry is best for Bess storage in 2025?

Sodium-ion, solid-state and LMFP (Lithium Manganese Iron Phosphate) are gaining attention for next-generation storage. However, for 2025 and beyond, LFP remains the chemistry of choice for most stationary BESS applications.

Technology costs for battery storage continue to drop quickly, largely owing to the rapid scale-up of battery manufacturing for electric vehicles, stimulating deployment in the power sector.
