

Can network structure optimization improve energy storage capacity?

Proposing a network and energy storage joint planning and reconstruction strategy: This paper innovatively proposes a bi-level optimization model that combines network structure optimization with energy storage system configuration, achieving a simultaneous improvement of power supply capacity and renewable energy acceptance capacity.

Is energy storage planning a single-objective model?

In recent years, many scholars have studied the planning of ESSs, however, most of the research models are single-objective models, and these models are difficult to consider the stability of the network and the economics of energy storage at the same time.

Why is the operation stability of the active distribution network decreasing?

In recent years, with the rapid development of renewable energy, the penetration rate of renewable energy generation in the active distribution network (ADN) has increased. Because of the instability of renewable energy generation, the operation stability of ADN has decreased.

What is the role of distributed generation and energy storage systems?

Distributed generation (DG) and energy storage systems (ESSs) play an important role in power grids with high renewable energy generation penetration rates (Wu et al., 2021a; Shi et al., 2022).

Does a network and energy storage Joint Planning and reconstruction strategy achieve cost minimization?

Additionally, the network and energy storage joint planning and reconstruction strategy proposed in this study achieves cost minimization under the constraint of limited resources and simultaneously enhanced both capacities. The strategy provides feasible solutions for power grid planning in actual applications.

How does a distribution network operate under steady-state conditions?

The distribution network is assumed to operate under steady-state conditions, with no consideration given to the impact of extreme conditions. The charging and discharging efficiency of the energy storage system is modeled using a simplified approach, without accounting for complex behaviors.
