Can lithiated nickel manganese cobalt oxide be produced by co-precipitation?

A process model has been developed and used to study the production process of a common lithium-ion cathode material, lithiated nickel manganese cobalt oxide, using the co-precipitation method. The process was simulated for a plant producing 6500 kg day⁻¹.

Does GM use nickel manganese cobalt?

GM's Ultium platform currently employs nickel manganese cobalt aluminum oxide batteries, also known as NCM, which uses 85% nickel, 5% cobalt, and 10% manganese for its cathode coating. However, cobalt and nickel are expensive, and cobalt is known to be mined with child labor, which is a human rights concern.

How is lithium nickel manganese cobalt oxide powder produced?

Schematic of a process for the production of lithium nickel manganese cobalt oxide powder. The product stream, a slurry of solid precipitates in a solution, is phase separated, and then filtered and washed several times. The filtration may be done in a rotary vacuum filter followed by drying in a spray dryer.
