Can sodium iron pyrophosphate be used as a cathode material?

Please reconnect Off-Stoichiometry of Sodium Iron Pyrophosphate as Cathode Materials for Sodium-Ion Batteries with Superior Cycling Stability As one of the important devices for large-scale electrochemical energy storage, sodium-ion batteries have received much attention due to the abundant resources of raw materials.

Is iron-based hybrid phosphate a suitable cathode material for sodium-ion batteries?

Therefore, the rational dual-carbon coating strategy improves the feasibility of 1.38-NFPP for practical use, thus revealing the great application prospects of iron-based hybrid phosphate materials. Iron-based mixed phosphate  $\text{Na}_{3.6}\text{Fe}_{2.6}(\text{PO}_4)_{1.6}\text{P}_2\text{O}_7$  (1.38-NFPP) is considered as an ideal cathode material for sodium-ion batteries.

Is phosphate a good cathode material for sodium ion batteries?

The off-stoichiometric iron-based phosphate ( $\text{Na}_{3.12}\text{Fe}_{2.44}(\text{P}_2\text{O}_7)_2$ , denoted as  $\text{Na}_{3.12}$ ) as a low cost and high structure stability cathode material has been widely studied for sodium-ion batteries (SIBs). However, the lower theoretical specific capacity (117 mAh/g) has seriously limited its practical application.

Are iron-based phosphates a viable alternative to lithium-ion batteries?

Iron-based phosphates for sodium-ion batteries (SIBs) have emerged as viable alternatives to lithium-ion batteries (LIBs) for grid-scale energy storage, owing to their high performance, exceptional low-temperature stability, and abundant resources.
