Are battery energy storage systems worth the cost?

Battery Energy Storage Systems (BESS) are becoming essential in the shift towards renewable energy, providing solutions for grid stability, energy management, and power quality. However, understanding the costs associated with BESS is critical for anyone considering this technology, whether for a home, business, or utility scale.

Why are batteries so expensive in Africa?

Mini grid and captive power developers often do not meet the minimum order volumes required for direct battery purchases from manufacturers. Lead-acid batteries, which are still the most used energy storage technology in Africa, are expensive to store due to the maintenance required whether they are in use or stored in a warehouse.

How do government incentives and subsidies affect battery storage?

Government incentives and subsidies play a significant role in the economics of battery storage. In the United States, the investment tax credit (ITC), which offers a tax credit for solar energy systems, has been extended to include battery storage when installed in conjunction with solar panels.

Can a battery energy storage system replace dispatchable thermal power?

In most cases battery energy storage systems (BESS) are used to provide short-duration power in the range of several hours. However, in the case of hybrid solar PV and wind plants, the aim is to replace dispatchable thermal power with the addition of BESS (potentially augmented with back-up generators).

How will fossil fuel cost volatility affect battery energy storage?

Fuel cost volatility and more calls for reductions of fossil fuel subsidies will coincide with continued cost reductions of battery energy storage systems over the next decade. Thus, it is anticipated that back-up supply will increasingly be provided by battery energy storage systems and decreasingly by fossil fuel generators.

How has the cost of battery storage changed over the past decade?

The cost of battery storage systems has been declining significantly over the past decade. By the beginning of 2023 the price of lithium-ion batteries, which are widely used in energy storage, had fallen by about 89% since 2010.
